

The M2 Water Meter Radio Transceiver provides a flexible conservation tool to track compliance with voluntary or mandatory watering restrictions.

## Description

The conservation function allows the user to establish allowable days, hours and consumption quantities for an account. Combinations of the allowable days and times can match virtually any conservation program's parameters. The radio's real-time clock ensures that the information matches the real-time consumption for all accounts.

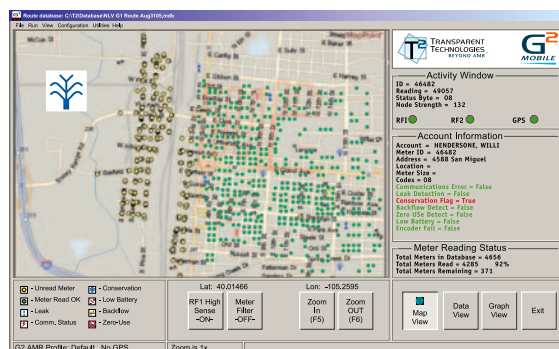

## Operation

The radio monitors consumption continually. If the watering conditions are met, the radio sets a flag indicating a conservation violation and transmits the flag with every transmission. The G2 Mobile System displays an icon for the meter indicating the conservation violation and also passes this information to the Data Center or the billing system. A datalog can be downloaded showing the consumption pattern that caused the violation.
